REGISTRATION OF PUPPIES

This is a chart of how many Maltese puppies that are born and registered every year. Note that Russia has almost “skyrocketed” when it comes to the number of puppies registered. And Taiwan that went up a lot in the early 2000’s and has now fallen a lot and is almost on the same level as Germany. On the second page there is a close up of the countries with the lower number of registrations to see them more clearly.

After the charts you can see the actual figures on the registrations.

IMPORTS

This is the chart for how many imports that are registered in each country every year. It's very nice to see that we have a large international cooperation and are exchanging dogs across the borders as this helps enhance the genetic diversity.

After the chart you can see the actual figures on the number of imports.

M

AVERAGE LITTER SIZE

These figures let us know what the average litter size in each country is. As you can see it's almost the same in each country, it's usually between 2 – 3,5 puppies.

After the chart there are the actual figures on average litter size.

PARTICIPANTS AT DOG SHOWS

This chart shows the average number of participants at dog shows. Unfortunately we only have figures from three countries, Sweden, Norway and Finland, it would be very fun to gather more information and be able to compare more.

INBREEDING

This chart shows the average inbreeding percentage in the litters that have been registered during the year. Inbreeding can be calculated by counting the mutual ancestors of a dog in its pedigree and how far they are apart. This is a good tool for breeder's to use when they are planning their combinations as we want to keep the inbreeding at a low level and increase the genetic diversity.

Unfortunately we only have figures from Sweden and Finland. But from these we can understand that the inbreeding percentage has dropped and is stabilizing.
